AUTHOR: Leonov, A. L., Scientific Secretary of the Section of Automation

TITLE: The first steps of the Section of Automation of the Scientific and Technical Council of the Goskhimkomitet (State Committee of Chemistry)

PERIODICAL: Khimicheskaya promyshlennost', no. 5, 1961, 71 - 73

TEXT: The Sektsiya avtomatizatsii (Section of Automation) of the Nauchno-tehnicheskiy sovet Gosudarstvennogo komiteta Soveta Ministrov SSSR po khimii (Scientific and Technical Council of the State Committee of Chemistry of the Council of Ministers USSR) is to deal with the most important scientific and technical problems of automation of the chemical industry. In this task the following persons are engaged: heads and directors of Branch NII (Scientific Research Institutes) of the Goskhimkomitet (State Committee of Chemistry), the Ts NIIKA, the holders of chairs of the MKhTI im. Mendeleyev, research engineers, planning engineers, chemists of industry, specialists of the Gosplan of the USSR, of the Gosudarstvennyy komitet

The first steps of the...

Soveta Ministrov SSSR po koordinatsii nauchno-issledovatel'skikh rabot (State Committee of the Council of Ministers USSR for the Coordination of Scientific Research Work) and of the State Committee of Chemistry. Plans for 1961 include discussion on cooperation between chemical engineers and specialists in automation in the elaboration of technological procedures and in the construction of the control system of automatic chemical plants of Stalinogorskiy khimkombinat (Stalinogorsk Chemical Combine) and Lisichanskiy khim kombinat (Lisichansk Chemical Combine) and Voronezhskiy zavod sinteticheskogo kautchuka (Voronezh Synthetic Rubber Plant), application of computer techniques, construction of special equipment, etc. N. N. Yelshin spoke about the examination of thematic plans of scientific research work of the institutes of the State Committee of Chemistry for 1961. Heads and directors of laboratories of the NIUIF, GIAP, NIOPiK, and other institutes spoke about cooperation between chemists and automation specialists. Apart from obtaining technological data required for automation, an engagement of special organizations of automation was considered. Especially the VNIISK dealt with the control of technological processes and their mathematical description. The VNIIG cooperates smoothly with the organizations dealing with the construction of equipment. The work of the

The first steps of the...

laboratories VNIIV, NIUIF, NII0gas, and others did not meet expectations. Some laboratories were charged with the development of continuous analytical methods and continuous testing of the properties of substances. The main organization of the chemical industry, OKBA, is to prepare a systematic coordination of the activities of Branch NII (Scientific Research Institutes) and render them methodical and scientific assistance. An extension of the automation laboratories of Branch NII and their establishment at all institutes was suggested. S. I. Vol'fkovich, S. A. Tsurikov, and B. I. Mordkovich (NIUIF) spoke about cooperation between analytical chemists, technologists, designers of equipment, electricians, etc. in the elaboration of new technological procedures. Combined brigades of the NIUIF with specialists of various organizations will be trained to cope with the greatest problems (e. g., removal of fluorine from phosphate fertilizers, calcination of magnesium sulfite in the Magnitogorskiy metallurgicheskiy kombinat (Metallurgical Combine of Magnitogorsk). To construct an automatic contact sulfuric-acid plant, cooperation between mathematicians, programing experts, physicists, chemists, thermodynamicists, experts in radio electronics, etc. will be required. L. M. Yakimenko spoke about cooperation between automation and technical laboratories of the KIP. As a result of Card 3/5

S/064/61/000/005/002/003
B110/B229

The first steps of the...

preliminary recommendations of the planning engineers, new industries and technological equipment with the assistance of leading industrial technologists are planned. V. N. Kraynov of GIAP pointed out the lack of technological knowledge of automation specialists on the one hand, and that of automation knowledge of technologists on the other. The automation laboratory of the GIAP carried out automatization of the nitric acid concentration plant in the Chernorechenskiy khimzavod (Chemical Work of Chernorechensk), whereby many technological rules were discovered. In the Stalinogorsk Chemical Combine technologists did not consider the opinion of automation specialists and had to reconstruct the plant. In research work done by GIAP on ammonia production of the Stalinogorsk Chemical Combine, automation specialists did not participate. For the automation of mazout gasification, various optimum control possibilities were suggested by technologists, and equipment was perfected by automation specialists. According to A. S. Voronov of NIOPiK, the quality of aniline colors was increased by automation, working conditions were improved at the same time, and optimum production was achieved. Technologists of the NII, of the KIP of the plants, and of OKBA branches take part in the automation of several procedures, theoretical foundation of automation levels, etc. In

Card 4/5

The first steps of the...

S/064/61/000/005/002/003
B110/B229

order to develop new equipment, it is necessary for Branch NII to contact the KB as soon as possible. Speedy establishment of automation sections in the Nauchno-tekhnicheskiy sovety (scientific and technical councils) of some branches of NII and contact with automation institutes of the CSR and other socialist countries were recommended.

TITLE: New methods of processing signals

SOURCE: Vestnik protivovozdushnoy oborony, no. 2, 1966, 59-65

TOPIC TAGS: signal processing, pulse compression, filter circuit

ABSTRACT: This article examines ways of obtaining a high range resolution when using long probing pulses with frequency or phase modulation and subsequent compression of the signal being received, this compression being accomplished by using appropriate methods of signal processing. Defining an optimal filter as a linear filter at whose output the ratio of the peak signal value to the effective noise value reaches a maximum, the author examines the amplitude-frequency characteristics and phase characteristics of an optimal filter. It is found that as a result of compression of pulses a high range resolution, corresponding to the use of very short probing pulses, is retained and the average power of the radar station increases. The author also discusses phase-manipulated signals and presents simplified diagrams of filters for extending pulses and for compressing pulses and a block diagram of a device for producing an optimal processing of a phase-manipulated signal. Orig. art. has: 7 figures.

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy, Geodesiya i aero-
fotos"zemka, 1958, Nr 1, pp 137-155 (USSR)

ABSTRACT:

This is a study of the simplification of geometric forms in triangulation in mines by excluding diagonal directions. The simplification of triangulation nets for special purposes was not dealt with. - It is pointed out that the opinion is unfounded that the existence of diagonal directions increases the total weight of the triangulation. An exclusion of these directions does not cause a decrease in the total weight and the geometric weight of the net. It is useful to construct triangulation nets in mines from triangles of a geometric form without diagonal connections. It should be avoided to set points into the various combinations of fixed quadrangles and pentagons. The analysis shows that such points do not increase the accuracy of the final result.

TITLE: Voltage Stabilizer (Stabilizator napryazheniya) (Proposal
of A.A. Petrov, N.V. Finashin, B.N. Sokolov)

PERIODICAL: Sbornik rats. predlozheniya. M-vo elektrotekhn. prom-sti
SSSR, 1955, Nr 56, pp. 12-15

ABSTRACT: A description is given of a voltage stabilizer setup with
a feedback to be used instead of a storage battery for
checking voltmeters and wattmeters of all systems and of
0.1 - 0.5 classes with measurement limits up to 300 v to
be made with d-c potentiometer sets of the Π H-2 or
 Π B-2 types. Specifications of the stabilizer: volt-
age 320 v, current up to 300 ma, output voltage variation
after 1 hr of initial heating is not more than 0.002 v
(0.0006%). A practical circuit diagram of the stabilizer
is presented (the following tubes were used: $C\Gamma 3C$,
 $6H9C$ - 2 pieces, $6H5C$ - 4 pieces, $5\Pi 3C$ - 3 pieces);
transformer and choke coil data are also given. Results
obtained in testing the setup permit recommending it for
the indicated purpose. V.A.L.

TITLE: Sorption of metals from an acetate solution by SKT activated charcoal

SOURCE: Zhurnal prikladnoy khimii, v. 39, no. 2, 1966, 359-362

TOPIC TAGS: sorption, chemisorption, acetic acid, ammonium compound, URANIUM

ABSTRACT: The sorption of zirconium, chromium, cadmium, zinc, lead, manganese, nickel, cobalt, uranium, barium, and cesium by activated SKT charcoal from solutions of acetic acid and ammonium acetate was studied. It was found that uranium is more readily sorbed by the charcoal than any of the other metals. The optimum mixture of acetic acid and ammonium acetate for the sorption of uranium is 0.45 mol acetic acid and 0.05 mol ammonium acetate. Addition of the latter to the acetic acid solution immediately increased the sorption by the charcoal; however, continued increase in the concentration of ammonium acetate beyond 0.05 mol reduced the sorptive capacity of the charcoal exponentially. It was found that NH_4NO_3 in a pH solution of 2.4-3.0 slightly increased the sorptive capacity of charcoal above a salt concentration of 1 mol/dm³. Experimental data was obtained on a bed of charcoal 60 mm high. Passage of the acetate so-

TITLE: Change in the antioxidant activity of cultures of the Hep-2 cell strain under the influence of external gamma-irradiation

PERIODICAL: Radiobiologiya, v.2, no.6, 1962, 819-823

TEXT: The author has used the oxidation of β -3,4-dioxyphenyl- α -aminopropionic acid (DCPA) as a system for studying the antioxidant properties of Hep-2 cells subjected to gamma irradiation. Monolayers of the cells grown in Roux bottles by standard methods were irradiated with a cobalt source in a total dose of 400 r at the rate of 290 r per minute. The cells were removed with versene and prepared as a suspension in pH 7.6 phosphate buffer in a concentration of 3×10^6 cells in 4.5 ml. DOPA was added to a final concentration of 3×10^{-6} M, and also a detergent ("sipo") to hold in solution the pigment formed by oxidation. The mixture was incubated at 37°C for 18 hours. The progress of the oxidation of DOPA was followed by determining the optical density of filtered samples removed at intervals. The oxidation of DOPA was also

B. N. Tarusov and B. V. Leonov

-5

The amount of free radicals in organs of rats and in cells cultured *in vitro* during and after irradiation has been studied.

Radicals were determined using the method Koslov-Tarusov. Intracellular polymerisation was measured by the use of low toxicity water-soluble monomers of the polyvinyl and acrylato nitrate groups. The monomers were introduced into cells at different intervals before and after irradiation. In addition, peroxide radicals in living cells

were determined for very low intensity radiations (Shuravlev). Both methods have some advantage over the paramagnetic resonance method since living cells are used.

It was shown that one radiation-induced free radicals in living cells are either oxidative or non-oxidative, and that radical formation continues after irradiation. The ratio of oxidative to non-oxidative radicals is reduced with increasing ionisation density.

The kinetics of radical formation in living cells were studied as a function of dose and time.

TITLE: Relation of radiosensitivity of rats with antioxidation activity of bone marrow and nonesterified fatty acid content in their blood while in a stress condition

SOURCE: Radiobiologiya, v. 3, no. 4, 1963, 518-522

TOPIC TAGS: antioxidation, bone marrow, nonesterification, fatty acid, stress reaction, radiosensitivity

ABSTRACT: Experiments were performed to determine changes in antioxidation activity of bone marrow and the NEFA (nonesterified fatty acid) content of the blood during a condition of stress and to compare them with changes in radiosensitivity of the organism during the same period. Female white rats were used for the experiment. Group I was exposed to irradiation but not subjected to stress. Groups II and III were subjected to stress produced by a 2-mamp electric current of 2-sec duration given at 2-min intervals. Group II animals were irradiated immediately after one hr of exposure to electric stress. Group III animals were subjected to irradiation 24 hr after exposure to electric stress for

Card 1/2

L 13330-63

ACCESSION NR: AP3003926

3 hr. In all cases irradiation was produced by Co⁶⁰ using EGO-2 equipment in 700-r doses at the rate of 260 r/min. A stress condition was found to lower the antioxidant activity of bone marrow, increase the NEFA content of the blood, and increase the radiosensitivity of rats. It is conjectured that owing to mobilization of fats from fat deposits antioxidant agents are used up more rapidly in a stress condition and that one of the mechanisms responsible for an increase in radiosensitivity of animals in a state of stress may be the oxidation of mobilized lipides. TITLE: Change in total fatty acid level of tissue cultures after gamma-irradiation

SOURCE: Radiobiologiya, v. 4, no. 1, 1964, 72-75

TOPIC TAGS: gamma-irradiation, fatty acid level, tissue culture strain Ner-2, lipid metabolism, nitrogen level, histochemical lipid investigation, lipid-protein ratio

ABSTRACT: The effect of gamma-irradiation on lipid metabolism was studied in tissue culture cells (strain Ner-2) biochemically and histochemically. The cells were gamma-irradiated (EGO-2 unit, 270 r/min) with single 400 r doses and investigated 4 days later. Total fatty acids were determined by Dole's method in 10-15 million cells after preliminary saponification of lipids and were expressed in microequivalents of palmitic acid for 10 million cells. Total nitrogen level of cells was determined. Cells were grown in a single layer and then stained with scarlet red for morphological investigation. Findings show that the total fatty acid level is 3.27 microequivalents

Card 1/3

ACCESSION NR: AP4015088

for irradiated cells compared to 1.81 microequivalents for control cells and that nitrogen levels are practically equal with 0.50 mg for irradiated cells and 0.52 mg for control cells. Histochemical investigations revealed the presence of lipids in control and irradiated cell protoplasm, but visually no appreciable difference in their number could be found. Possible explanations for the higher lipid level in irradiated cells include increased synthesis of fats, lower consumption of fats, and intensified absorption of ready lipids from the nutritive medium. The lipid-protein ratio of 6.3 for irradiated cells and 3.6 for control cells suggests extensive cell degeneration by the 4th day after irradiation. Lack of quantitative difference in lipids between control and irradiated cells determined histochemically does not contradict biochemical findings because the histochemical method does not reveal finer quantitative changes. The accumulation of lipids in irradiated cells may be a radioprotective reaction as found for example in irradiated yeast cells. Orig. art. has: 1 figure, 1 table.

ORG: none

TITLE: The tissue culture method in radiobiological investigations

SOURCE: Voprosy obshchey radiobiologii (Problems of general radiobiology). Moscow, Atomizdat, 1966, 135-144

TOPIC TAGS: radiobiology, tissue culture, radiation biologic effect

ABSTRACT: The article is based on a literature survey and presents data on tissue culture methods in radiobiological studies. These materials indicate that tissue cultures are good models for studying various aspects of radiation biologic effects: effect of irradiation dose size and rate on the degree of radiation injury, biologic radiation action with different ionization density, restoration processes of irradiated cells and problems of radioprotection. Growth of tissue cultures in the form of a layer or suspension makes it possible to conduct physicochemical and histological investigations of cells and investigations of protein, lipid and carbohydrate metabolism. Experimental data based on tissue culture investigations concur with the present position of radiobiology and bring us closer to uncovering the mechanism of radiation biologic effects. PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1958, Nr 9, pp 31 - 33 (USSR)

ABSTRACT: The authors recommend the construction of overflow sills with their terminal parts working as console water spillways for low pressure dams, instead of installing expensive reinforced concrete apron wells. It was observed that overflow sills in the old dams successfully protect them from the erosive action of lower waters. There are 3 diagrams and 2 Soviet references.
